Sleepledger

EXECUTIVE SUMMARY

Sleepledger, Inc. (S Corp)

The Problem

Shift workers do not sleep good. This is a well known problem that effects millions of workers across America and the world. Nurses work night shifts, truck drivers drive at all hours, factory workers rotate between days and nights, and all of them have fatigue. Fatigue can lead to accidents, mistakes, health problems, and lower productivity. Occupational clinics, which are the clinics that see workers for work related health matters, do not have a good way to know how their patients are sleeping and so they cant give good recomendations. Right now the clinics mostly just ask the worker how they have been sleeping and the worker says fine or not fine. This is not data driven and is a big gap in the market that nobody is addressing in a meaningful way.

Our Solution

Sleepledger is a web app that collects sleep and schedule data from shift workers and gives it to occupational clinics so they can recommend personalized rest plans and spot fatigue risks early. The worker goes to the website and types in what time they went to sleep, what time they woke up, and what shifts they worked. Our system then does analytics on the data and produces a score for each worker. The clinic has a dashboard where they can see all of there workers and who has a high score. Then the clinic can make a rest plan for the worker. We believe this is a holistic end to end solution that leverages the power of data to transform how fatigue is managed. Our prototype MVP has been built and has the worker log page and a basic clinic page.

Market Opportunity

The market for this is very large. There are many shift workers in the United States, probably around 15 to 20 percent of all workers, which is tens of millions of people. There are also thousands of occupational clinics. The sleep health market is growing every year and is expected to be worth many billions of dollars. If we only capture a small percent of this market we will be very succesful. We have not done a formal market study yet but we are confident the numbers are big. Our target customers are occupational clinics first, and later we may also go after employers, hospitals, trucking companies, and maybe insurance companies and even individual consumers who want to track there sleep.

Business Model

Our business model has a few options and we are still deciding which is best. One option is that clinics pay a monthly subscription for the dashboard. Another option is that workers pay a small fee to use the app. A third option is that employers pay for the whole thing for there workers. We might also sell the data and analytics to other companies, or charge for a consulting service where we help clinics set up the rest plans. We think a mix of these will work and will decide when we talk to more customers. Pricing has not been decided yet but it would be somewhere between a low and medium price per month. Over time we expect revenue to grow as more clinics and workers join the platform.

Competition

There are many sleep trackers and wearables on the market, as well as sleep apps, but these are mostly for regular consumers and not for shift workers and clinics. Some big companies make smart watches that track sleep automatically. We think we are different because we focus on shift workers and clinics and combine the sleep with the work schedule. We do not think any competitor does exactly what we do, although we have not searched very thoroughly. Our advantage is that we understand the problem and are first to this specific niche. Large companies could copy us, but we believe we can move faster because we are a small and agile

team.

Team

Brandon Teller is the CEO and is a senior at our university studying business. He came up with the idea after his uncle, who is a night shift worker, said he was always tired. Brandon is in charge of strategy, sales, and the vision of the company.

Kiara Oduya-Whitfield is the head of product and is a junior studying psychology with a minor in health sciences. She has an interest in sleep and has read many articles about it. She is responsible for the user experience and for the content of the rest plans.

Marcus Delvecchio is the CTO and is a sophomore studying computer science. He built the prototype MVP over a few months and is responsible for the website and all the technical parts including the analytics.

We do not currently have a clinician or a sleep doctor on the team, but we plan to find an advisor in the future.

Milestones and Financials

So far we have defined our core business concept, formed our legal entity as an S Corp, built a prototype MVP, and launched a website. We have not yet had any paying customers or any clinics using the product. We have shown the prototype to a few friends and family members, who said it looks good. We have not yet run a pilot. We have not yet had any revenue, and our expenses so far have been small, mostly the cost of forming the company and the website hosting, which the founders paid for themselves.

For financials, we project that in year one we will have a small number of clinics and some revenue, and that by year three we will have grown to many clinics and be profitable. We have not built a detailed financial model yet, but we believe the growth will be rapid because the market is so big. Our main costs will be software development, marketing, and eventually hiring staff. We expect to break even at some point once we have enough customers.

What We Are Asking For

We are asking for prize money from the competition to help us take Sleepledger to the next level. We would use the funds for further development of the product, marketing, and finding our first clinic customers. We would also like to get mentorship and connections to people in the health industry and investors, since we do not have much experience in healthcare. Any amount would be helpful, but a larger amount would let us hire a developer and do a real pilot. We also would like advice on privacy and regulation, since we know health data can be sensitive and there are laws but we are not sure exactly which ones apply to us.

Conclusion

Sleepledger has the potential to change how fatigue is managed for shift workers everywhere. With a huge market, a passionate team, and a working prototype, we believe we are well positioned to succeed and to make a real difference in peoples lives. We thank the judges for there time and consideration.
